

Case Study: Insights into Product Management with Shubham Mishra

Introduction

This case study explores insights shared by Shubham Mishra, a former Product Manager of MPC and the current Product Manager of DAM and other client products at Jio. His experience provides a comprehensive understanding of the product management lifecycle, from ideation to deployment and post-launch performance analysis.

Product Development Lifecycle

1. Client Interaction & Requirement Gathering

- The process begins with a client meeting where the client shares requirements for a new feature or module in their product.
- The Product Manager gathers insights and aligns them with business goals to ensure feasibility.

2. Ideation & Wireframing

- After understanding the requirements, brainstorming sessions are conducted to conceptualize the feature/module.
- A basic wireframe is created and presented to the client for validation.
- For media-driven modules, a **Content Requirement Document (CRD)** is created, detailing assets like banners, images, and videos needed for implementation.
- Once the client approves the wireframe and CRD, the development process begins.

3. User Story Creation

- The Product Manager creates **user stories**, which are divided into two sections:
 1. **UI-based stories** – Focused on front-end design and user interactions.
 2. **Functionality-based stories** – Covering the backend logic and overall workflow.

4. UI/UX Design & Approval

- The UI/UX team from the **App Dev COE** team collaborates to develop a prototype.
- The prototype undergoes validation from senior leadership, such as **KK Sir**, to ensure alignment with user experience and business goals.

5. Development Walkthrough & Execution

- A **developer walkthrough** is conducted, where developers review the feature and discuss feasibility.
- Once all queries are resolved, the development process begins.

6. Testing & Deployment

- After development is completed, the Product Manager conducts a **walkthrough for testers** to ensure a thorough understanding of the feature.
 - The feature undergoes rigorous testing. If issues arise, they are resolved immediately.
 - The product is then deployed, and any deployment-related issues are addressed promptly.
-

Post-Launch Performance Analysis

1. KPI (Key Performance Indicators) Tracking

- The Product Manager monitors user engagement by tracking:
 - **Total logins**
 - **Drop-off rates (users who leave mid-way)**
 - **Feature-specific engagements**
 - **Total clicks** (each click is tracked as a KPI to analyze user behavior)

2. KPI Ratios & Reporting

- Metrics such as **Total Likes / Total Users** help understand engagement levels.
 - A final dashboard report is prepared and shared with the client, offering insights into:
 - Which engagements users prefer the most.
 - Which features drive higher engagement.
-

Tools & Preferences

- Shubham uses **Mood Board and FigJam** for collaboration, as they provide a more interactive and visual approach to brainstorming.
 - His expertise lies in the **Ideation and Growth Phases**, where he actively contributes to product strategy and user engagement.
-

Types of Projects in App Dev COE Team

1. **Long-Term Products** – Continuous development through agile sprints (e.g., MPC, DAM).
 2. **Short-Term Products** – Fast-paced development due to time constraints, ensuring value-driven execution for client projects.
-

Key Takeaways & Recommendations

- Specializing in a niche within **product management** (e.g., Ideation, Delivery, Launch, Growth) helps in career advancement.
 - Pursuing a **professional IBM Product Management course** is recommended to gain structured expertise in the field.
-

Conclusion

Shubham Mishra's approach to product management emphasizes structured problem-solving, efficient collaboration, and data-driven decision-making. His insights highlight the importance of client communication, iterative development, and KPI-driven performance tracking in building successful products.

By mastering these areas and leveraging the right tools, product managers can optimize workflows, enhance user engagement, and drive business growth effectively.
