

Daily Responsibilities of a Developer

- 1. Scrum Meetings**
Begin the day by participating in scrum meetings, held daily, weekly, or bi-weekly. These meetings help track progress, align with the team, and identify any blockers or concerns.
- 2. Task Execution and Issue Debugging**
Focus on completing tasks assigned by the manager. This involves identifying, debugging, and resolving issues within the codebase to ensure smooth application functionality.
- 3. Collaboration with Senior Developers and Product Teams**
Engage with senior developers or the product team when additional support or clarification is required. This collaboration helps in troubleshooting and resolving complex issues effectively.
- 4. Production Issue Resolution**
Occasionally assist in addressing production issues, especially those related to previously developed features. Ensure timely resolution of critical issues to maintain application stability.
- 5. Code Reviews**
Participate in reviewing peer code to uphold high coding standards. Provide constructive feedback, ensure adherence to best practices, and encourage a collaborative team environment.
- 6. Continuous Learning and Improvement**
Dedicate the remaining time to self-learning, exploring new technologies, preparing for upcoming tasks, addressing technical debt, or enhancing existing features.
