

Case Study: Enhancing Customer Experience and Operational Efficiency in JioPOS Lite

Introduction

JioPOS Lite is a digital solution introduced by Jio in 2020 to streamline the recharge process and eliminate intermediary commission costs. It serves as both a B2B and B2C platform, allowing retail shop owners (businessmen) to conduct recharges and earn commissions while also enabling individual customers to earn a small commission by facilitating recharges for others.

Recently, a discussion was held with Ms. Gauri Krishnamoorthy, Product Manager (PM) of JIO.COM/JPW (Jio Partner World), where she shared insights into her role, the product's challenges, and the structured approach taken to improve JioPOS Lite. This case study outlines key learnings from the discussion, focusing on problem-solving, stakeholder collaboration, and the product development lifecycle.

Problem Identification & Prioritization

A core responsibility of the Product Manager is identifying and resolving product-related issues. The approach to problem-solving is structured into the following stages:

Stage 1: Identifying the Problem

1. Determine the issue affecting the application.
2. Assess the importance and impact of the issue.
3. Establish a timeline for resolution based on business needs and technical feasibility.

Stage 2: Prioritization of Issues

- Ms. Gauri provided an example where she encountered two issues simultaneously:
 1. High processing time due to 800GB of daily data transfer.
 2. A UX issue affecting user navigation.
- The prioritization involved assessing:
 - The impact on business operations and end-user experience.
 - The urgency of resolution based on user complaints and system stability.
 - The cost and complexity of implementing a solution.
- In this case, the performance issue was prioritized as it directly affected transaction speeds and overall system efficiency.

Stage 3: Solution Design & Approval

- The PM consults with the **Solution Architect (SA)**, who assesses the impact across different teams (Database, Development, etc.).
- The SA proposes a solution, which is then reviewed by the PM, who may suggest enhancements.

- Example: Ms. Gauri identified a security risk in customer log data and suggested adding OTP verification to mitigate potential misuse of dummy data.
 - Once the solution is refined, it moves forward for implementation.
-

Stakeholders in the Product Development Process

The JioPOS Lite product lifecycle involves four main stakeholders:

1. **Business Team** – Defines product requirements and strategic goals.
2. **Delivery Team (including Project Managers)** – Ensures execution and coordination among teams.
3. **Product Manager** – Owns the product vision, prioritizes issues, and ensures alignment with business objectives.
4. **Solution Architect** – Designs technical solutions, ensuring system scalability and efficiency.

Workflow of Requirement to Implementation

1. Business team provides requirements to the **Delivery Team**.
 2. The **Project Manager** in the Delivery Team requests a solution from the **Solution Architect**.
 3. The **Solution Architect** presents a design walkthrough in a scrum call attended by the **Product Manager**, testers, and the entire delivery team.
 4. Queries and concerns raised during the meeting are documented as **open points** and resolved before implementation.
 5. The final solution design is handed over to the **Product Manager** for further refinement.
-

Product Manager's Role in Implementation

Wireframing and Collaboration with Designers

- The **Product Manager** translates solutions into basic wireframes or documentation for the **Design Team**.
- A wireframe is preferred over a textual document for better clarity and visual representation.
- Example: A login field for business partners required a 12-digit code, but the first six digits (UDAYAM) were constant. Instead of requiring full entry, the PM suggested making the first six digits static, improving user efficiency.
- Designers review wireframes and ask questions related to:
 - Field placements and design rationale.
 - User journey considerations and feature descriptions.
 - Number of buttons, placeholders, and navigation elements.

Development Process & Testing Phases

1. The **Product Manager** provides a detailed walkthrough of the product features to the **Development Team**, using wireframes and the SA's solution document.
 2. Developers begin coding and perform internal testing in **Dev Environment**.
 3. Testers validate functionality in **SIT (System Integration Testing) Environment** to ensure system-wide compatibility.
 4. **Replica Environment Testing** is conducted before the final deployment to mirror real-world usage.
 5. The **Technical Operations (TOPS) Team** handles the final deployment for the actual product launch, ensuring stability and performance.
-

Conclusion

JioPOS Lite is a robust digital solution designed to optimize the recharge process for both business owners and individual users. The structured approach taken by Ms. Gauri and her team ensures a balance between performance improvements, security enhancements, and user experience refinements.

This case study highlights the importance of:

- Identifying and prioritizing product issues effectively.
- Collaborative problem-solving among multiple stakeholders.
- A well-defined development workflow, ensuring smooth implementation.

By continuously iterating on solutions and refining the user experience, JioPOS Lite remains a crucial tool for empowering business owners and customers alike in the digital recharge ecosystem.

Case Study: Insights into Product Management with Shubham Mishra

Introduction

This case study explores insights shared by Shubham Mishra, a former Product Manager of MPC and the current Product Manager of DAM and other client products at Jio. His experience provides a comprehensive understanding of the product management lifecycle, from ideation to deployment and post-launch performance analysis.

Product Development Lifecycle

1. Client Interaction & Requirement Gathering

- The process begins with a client meeting where the client shares requirements for a new feature or module in their product.
- The Product Manager gathers insights and aligns them with business goals to ensure feasibility.

2. Ideation & Wireframing

- After understanding the requirements, brainstorming sessions are conducted to conceptualize the feature/module.
- A basic wireframe is created and presented to the client for validation.
- For media-driven modules, a **Content Requirement Document (CRD)** is created, detailing assets like banners, images, and videos needed for implementation.
- Once the client approves the wireframe and CRD, the development process begins.

3. User Story Creation

- The Product Manager creates **user stories**, which are divided into two sections:
 1. **UI-based stories** – Focused on front-end design and user interactions.
 2. **Functionality-based stories** – Covering the backend logic and overall workflow.

4. UI/UX Design & Approval

- The UI/UX team from the **App Dev COE** team collaborates to develop a prototype.
- The prototype undergoes validation from senior leadership, such as **KK Sir**, to ensure alignment with user experience and business goals.

5. Development Walkthrough & Execution

- A **developer walkthrough** is conducted, where developers review the feature and discuss feasibility.
- Once all queries are resolved, the development process begins.

6. Testing & Deployment

- After development is completed, the Product Manager conducts a **walkthrough for testers** to ensure a thorough understanding of the feature.
 - The feature undergoes rigorous testing. If issues arise, they are resolved immediately.
 - The product is then deployed, and any deployment-related issues are addressed promptly.
-

Post-Launch Performance Analysis

1. KPI (Key Performance Indicators) Tracking

- The Product Manager monitors user engagement by tracking:
 - **Total logins**
 - **Drop-off rates (users who leave mid-way)**
 - **Feature-specific engagements**
 - **Total clicks** (each click is tracked as a KPI to analyze user behavior)

2. KPI Ratios & Reporting

- Metrics such as **Total Likes / Total Users** help understand engagement levels.
 - A final dashboard report is prepared and shared with the client, offering insights into:
 - Which engagements users prefer the most.
 - Which features drive higher engagement.
-

Tools & Preferences

- Shubham uses **Mood Board and FigJam** for collaboration, as they provide a more interactive and visual approach to brainstorming.
 - His expertise lies in the **Ideation and Growth Phases**, where he actively contributes to product strategy and user engagement.
-

Types of Projects in App Dev COE Team

1. **Long-Term Products** – Continuous development through agile sprints (e.g., MPC, DAM).
 2. **Short-Term Products** – Fast-paced development due to time constraints, ensuring value-driven execution for client projects.
-

Key Takeaways & Recommendations

- Specializing in a niche within **product management** (e.g., Ideation, Delivery, Launch, Growth) helps in career advancement.
 - Pursuing a **professional IBM Product Management course** is recommended to gain structured expertise in the field.
-

Conclusion

Shubham Mishra's approach to product management emphasizes structured problem-solving, efficient collaboration, and data-driven decision-making. His insights highlight the importance of client communication, iterative development, and KPI-driven performance tracking in building successful products.

By mastering these areas and leveraging the right tools, product managers can optimize workflows, enhance user engagement, and drive business growth effectively.
